CSA0889 – Python Programming

Assignment – 3

- 1.** A bakery sells loaves of bread for 185 rupees each. Day old bread is discounted by 60 percent. Write a python program that begins by reading the number of loaves of day old bread being purchased from the user. Then your program should display the regular price for the bread, the discount because it is a day old, and the total price. All of the values should be displayed using two decimal places, and the decimal points in all of the numbers should be aligned when reasonable values are entered by the user.

Sample Input:

Enter the number of fresh loaves purchased: 5

Enter the number of day-old loaves purchased: 3

Sample Output:

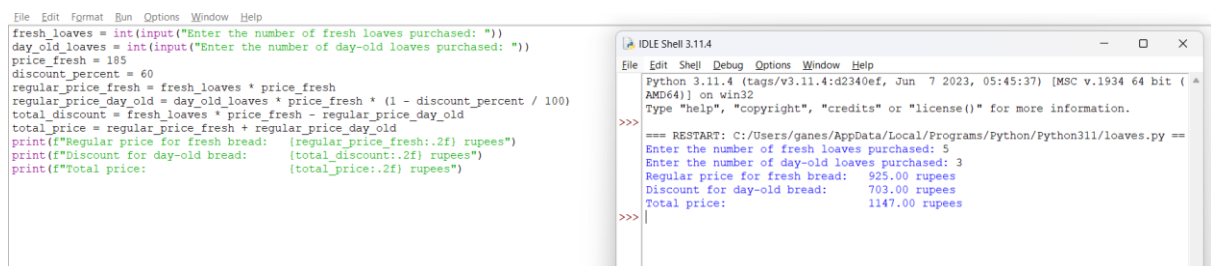

Regular price: Rs.185.00

Amount of new loaves: 925.00

Amount of day-old loaves: 333.00

Total amount: Rs. 1258.00

Test cases: 1. 4, 6 2. -1,5 3. 0,6 4. 7,8 5. 3,4

```
File Edit Format Run Options Window Help
fresh_loaves = int(input("Enter the number of fresh loaves purchased: "))
day_old_loaves = int(input("Enter the number of day-old loaves purchased: "))
price_fresh = 185
discount_percent = 60
regular_price_fresh = fresh_loaves * price_fresh
regular_price_day_old = day_old_loaves * price_fresh * (1 - discount_percent / 100)
total_discount = fresh_loaves * price_fresh - regular_price_day_old
total_price = regular_price_fresh + regular_price_day_old
print(f"Regular price for fresh bread: (regular_price_fresh:.2f) rupees")
print(f"Discount for day-old bread: (total_discount:.2f) rupees")
print(f"Total price: (total_price:.2f) rupees")

Python 3.11.4 (tags/v3.11.4:d2340ef, Jun 7 2023, 05:45:37) [MSC v.1934 64 bit (AMD64)] on win32

Enter the number of fresh loaves purchased: 5
Enter the number of day-old loaves purchased: 3
Regular price for fresh bread: 925.00 rupees
Discount for day-old bread: 703.00 rupees
Total price: 1147.00 rupees
>>>
```

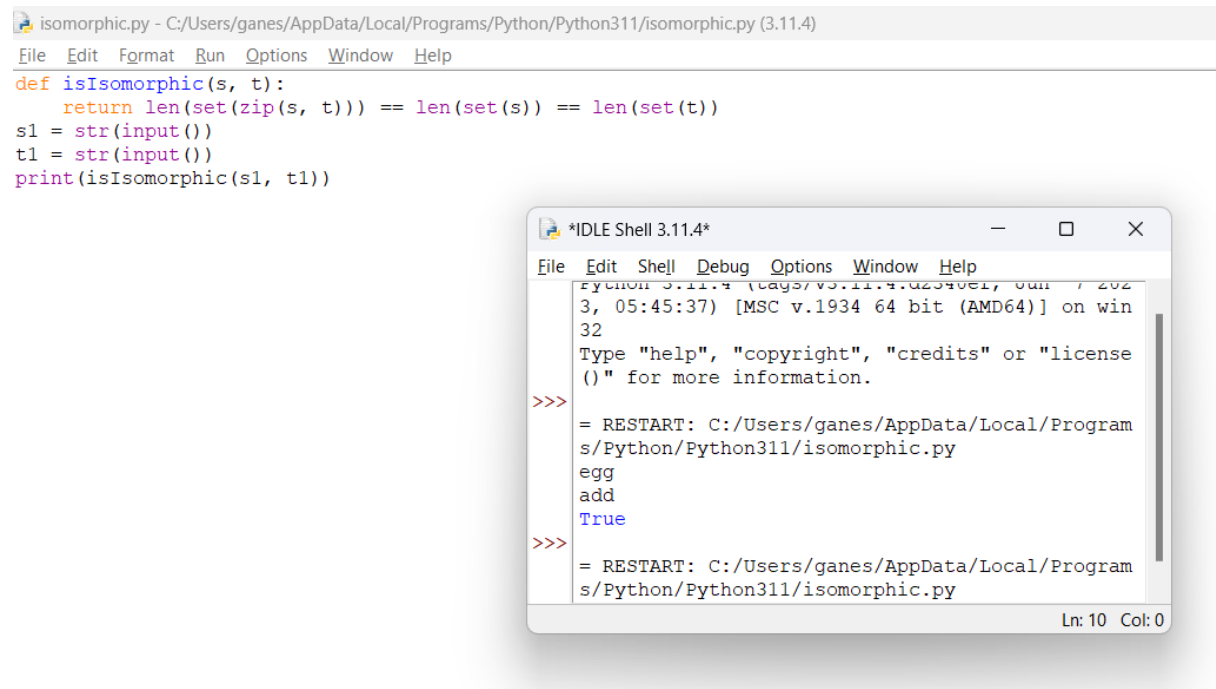

- 2.** Given two strings “s” and “t”, determine if they are isomorphic. Two strings “s” and “t” are isomorphic if the characters in “s” can be replaced to get “t”. All occurrences of a character must be replaced with another character while preserving the order of characters. No two characters may map to the same character, but a character may map to itself.

Constraints:

✓ s and t consist of any valid ascii character.

Test Cases:

- 1.Input: s = "egg", t = "add" Output: true
- 2.Input: s = "foo", t = "bar" Output: false
- 3.Input: s = "paper", t = "title" Output: true
- 4.Input: s = "fry", t = "sky" Output: true
5. Input: s = "apples", t = "apple" Output: false

3. Given n non-negative integers $a_1, a_2, a_3, \dots, a_n$ where each represents a point at coordinate (i, a_i) . ' n ' vertical lines are drawn such that the two endpoints of line i is at (i, a_i) and $(i, 0)$. Find two lines, which together with x-axis forms a container, such that the container contains the most water. The program should return an integer which corresponds to the maximum area of water that can be contained (maximum area instead of maximum volume sounds weird but this is the 2D plane we are working with for simplicity).

Note:

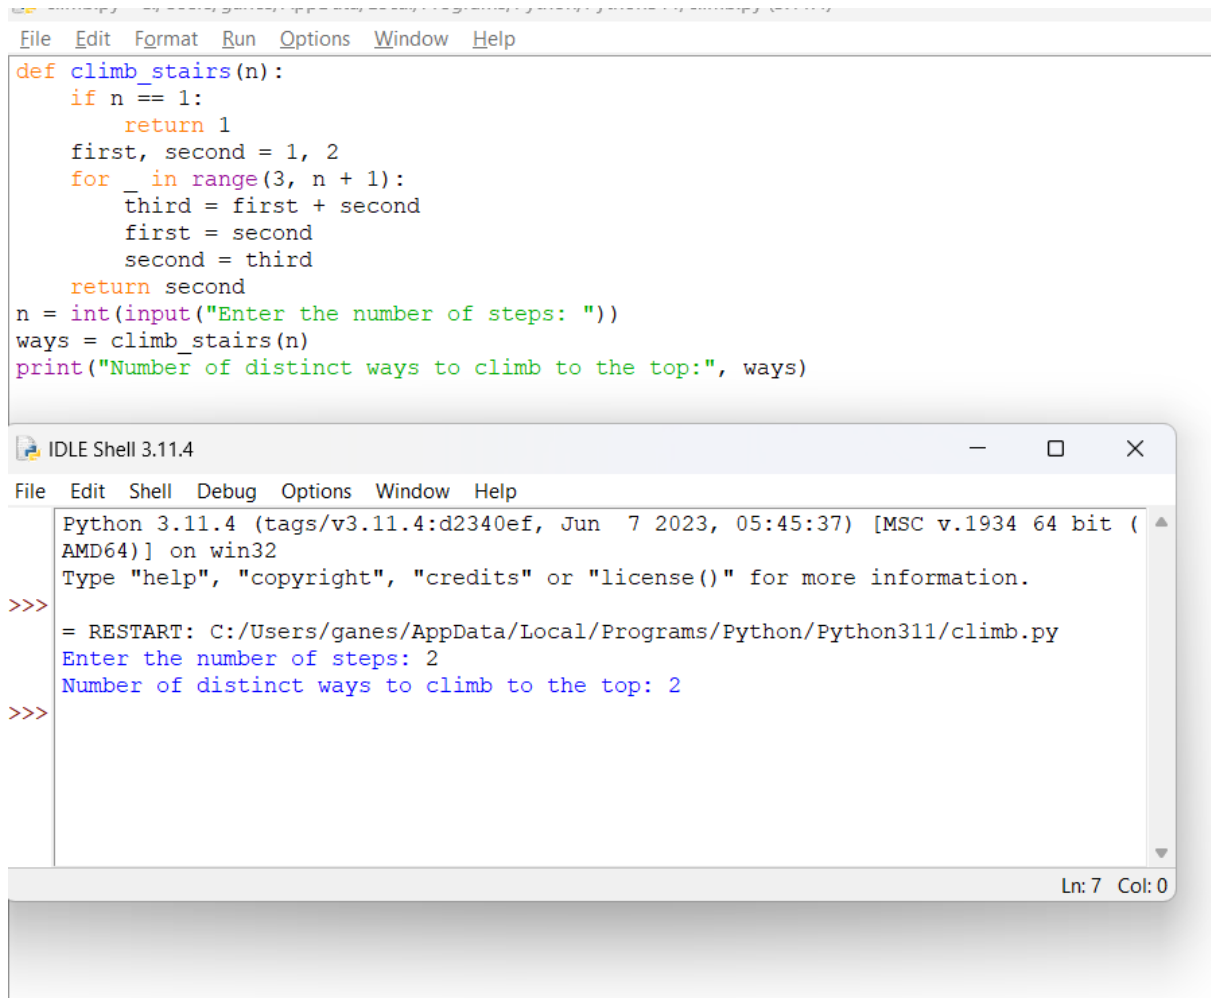

You may not slant the container.

Test case:

- 1.Input: array = [1, 5, 4, 3] Output: 6
- 2.Input: array = [3, 1, 2, 4, 5] Output: 12
- 3.Input: array = [1,8,6,2,5,4,8,3,7] Output: 49

4.Input: array = [1,1] Output: 1

5.Input: array = [7,3] Output: 3

```

Enter the number of steps: 2
Number of distinct ways to climb to the top: 2
>>>
```

Ln: 7 Col: 0

5. In daily share trading, a buyer buys shares in the morning and sells them on the same day. If the trader is allowed to make at most 2 transactions in a day, whereas the second transaction can only start after the first one is complete (Buy->sell->Buy->sell). Given stock prices throughout the day, find out the maximum profit that a share trader could have made.

Test Case:

1.Input: prices = [7,1,5,3,6,4] Output: 7

2.Input: prices = [7,6,4,3,1] Output: 0

3.Input: [10, 22, 5, 75, 65, 80] Output:87

4.Input: [2, 30, 15, 10, 8, 25, 80] Output:100

5. Input: [5,25,3,10,7,9] Output:27
